

Dezzy Check Splitter

How to Use

LPT Realty | Accounts Receivable

Dezzy Check Splitter takes a single bulk scan of check packets, automatically detects divider pages, splits the scan into individual transaction files, uses OCR to propose filenames, and outputs individually named PDFs after your review.

Prep

These steps happen outside the tool, but they determine whether processing goes smoothly.

1. **Prep packets:** Remove all staples from each check and its related documents.
2. **Insert dividers:** Place a red cardstock divider sheet between every packet.
3. **Orient loose checks:** Individual checks must be placed horizontally (landscape) in the tray. Vertical placement causes OCR to fail on that packet.
4. **Stack and scan:** Place the full batch upside down in the scanner tray. Execute a single bulk scan. The scanner outputs one large PDF.

Note: After the scan, retrieve each physical check, separate it from its paper documents, and paper clip the documents together. This is unchanged from the current workflow.

Using the Tool

5. Open Dezzy Check Splitter on your desktop.
6. Upload the bulk PDF. Drag and drop the file from the bulk scans folder into the upload area, or click to browse.
7. Wait for processing. The tool will detect divider pages, split the PDF into packets, and run OCR on each packet. A progress indicator shows each stage. This typically takes under a minute for a standard batch.
8. Review the preview screen. Each packet appears as a thumbnail with a proposed filename. Packets that need attention are sorted to the top.

Green — High Confidence

Address detected with high confidence. Quick visual check, then approve.

Yellow — Low Confidence

Address detected but uncertain. Verify the highlighted OCR source before approving.

Red — No Address Found

No address detected. Manually enter the property address before approving. Expected on ~30% of packets.

9. For each packet, verify the proposed filename. The OCR source is highlighted on the thumbnail so you can confirm where the address was pulled from.
 - a. If the filename looks correct: click Approve.

- b. If the filename is wrong: click the filename field to edit it inline, then click Approve.
- c. If the packet shows red (no address found): type the property address in the filename field before approving. This is expected on roughly 30% of packets and is not a tool error.
- d. Zoom: Use the magnifier + / – buttons on the badge row above any preview to zoom in (1× → 3×) and confirm the correct address and check# were scanned. Each + press recenters on the highlighted region and brings up scrollbars so you can pan around.

Tip: All packets must be approved before you can export. The export button activates once every packet has a confirmed filename.

- 10. Click Download ZIP. The tool packages all approved PDFs into a single ZIP file.
- 11. Copy the PDFs from the ZIP into the AR SharePoint folder.
- 12. Delete the master bulk scan PDF from the bulk scans folder once files are confirmed in SharePoint.

File Naming

The tool proposes filenames in this format:

LPTR. [Check #] - [Property Address]

Example: LPTR.1042 - 123 Main St Orlando FL

You can edit any proposed filename inline in the preview screen before approving. The format should match the existing naming convention in SharePoint.

What to Expect

Divider detection	99%+ accuracy on clean scans with properly inserted red dividers.
OCR auto-naming	85%+ of addressable packets auto-named without correction (excludes the ~30% of packets that contain no property address in the documents).
Review time	Target under 20 seconds per packet in the preview interface.
Packets with no address	Flagged red in the preview. Enter the address manually. This is expected behavior, not a tool error.
